
Reducing Friction in Clinical Workflow

Mark Chignell, Anita Ko, Phil Lam, Hao Shi, and Erin Yu
Interactive Media Lab, Mechanical and Industrial Engineering, University of Toronto

Overview

- Friction in Clinical Workflow
 - It's everywhere we've looked
 - Reducing Friction with Sensors
 - Project 1
 - RFID-driven smart routing, alerting, and notification
 - Project 2
 - Kinect- (3D imaging-) driven Game-based Cognitive assessment
-
- Project 3
 - Accelerometer driven Gait Based of health status (e.g., falls risk and neuro-rehabilitation)

RFID-Driven Routing and Notification

- Readers in Physician Smartphones
 - Tags on people, in Rooms or Near Equipment
- Transmission of Sensed TagIDs to Intranet/Cloud
- Triangulation/inference of Tag location/Proximity
- Inference
 - Activity
 - Interruptability
- Modification of Device behaviour
 - based on inferred activity and workload
 - Accepting Calls, notifying test results, automated login

Who and what are around the user?

Initial Testing of Filters

Signal Strength as a Cue for Distance

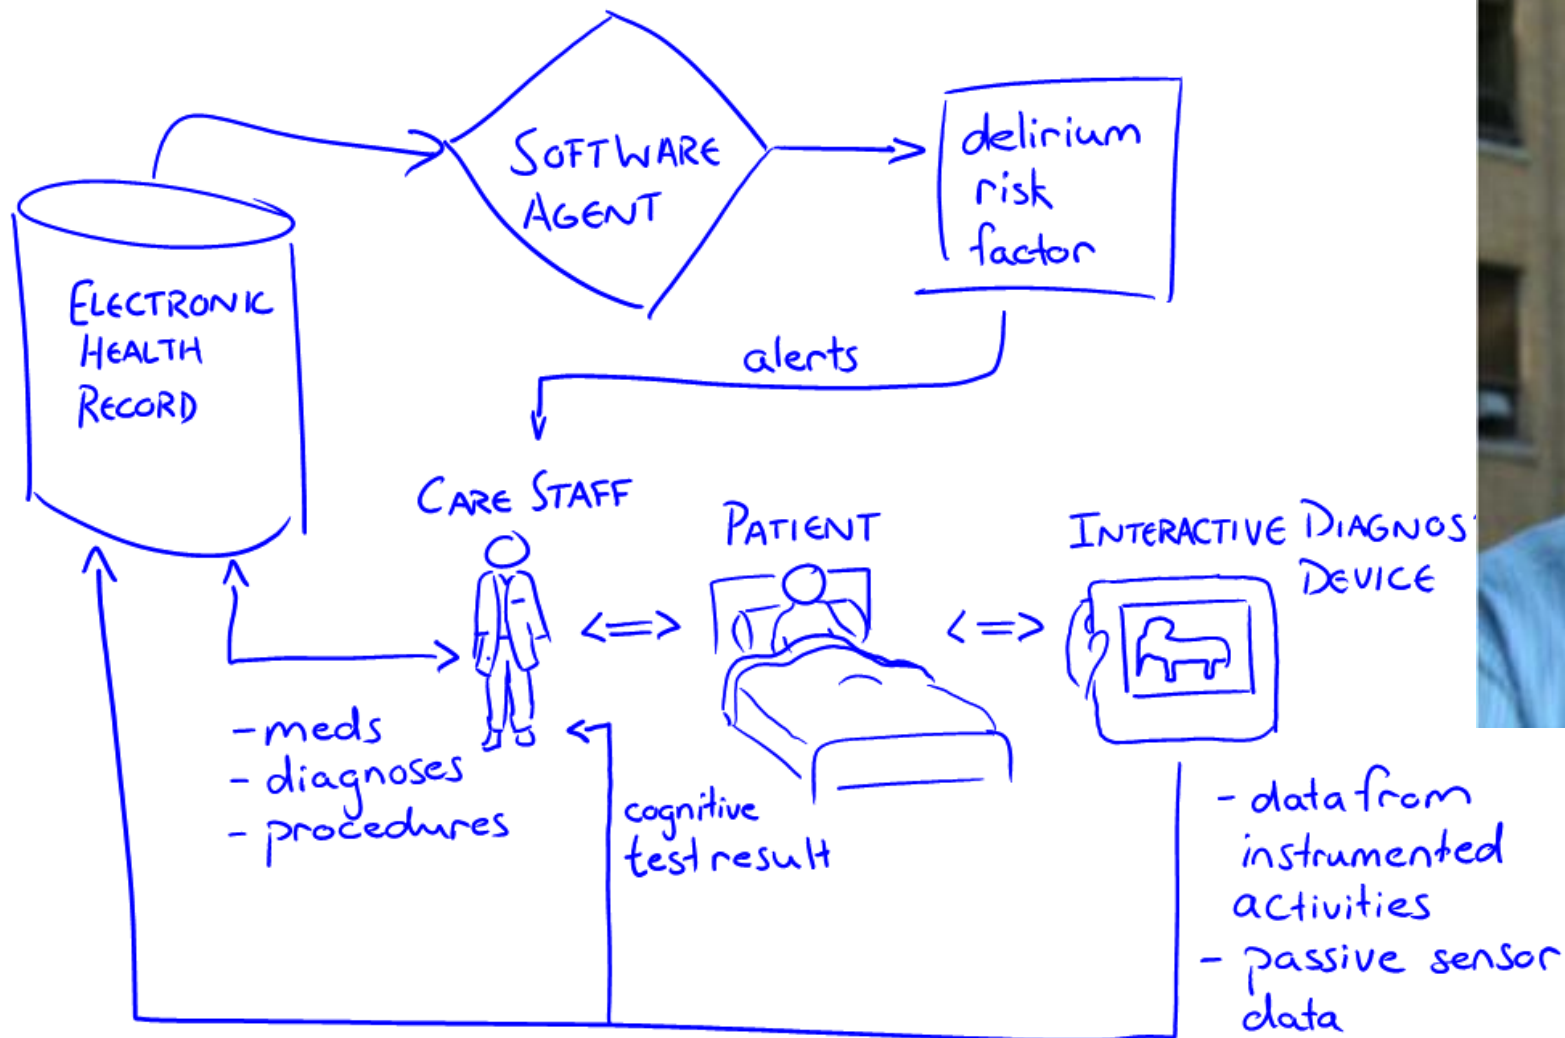

Video Demo

(thanks Phil, Hao, David, Mehdi and Mahsa)

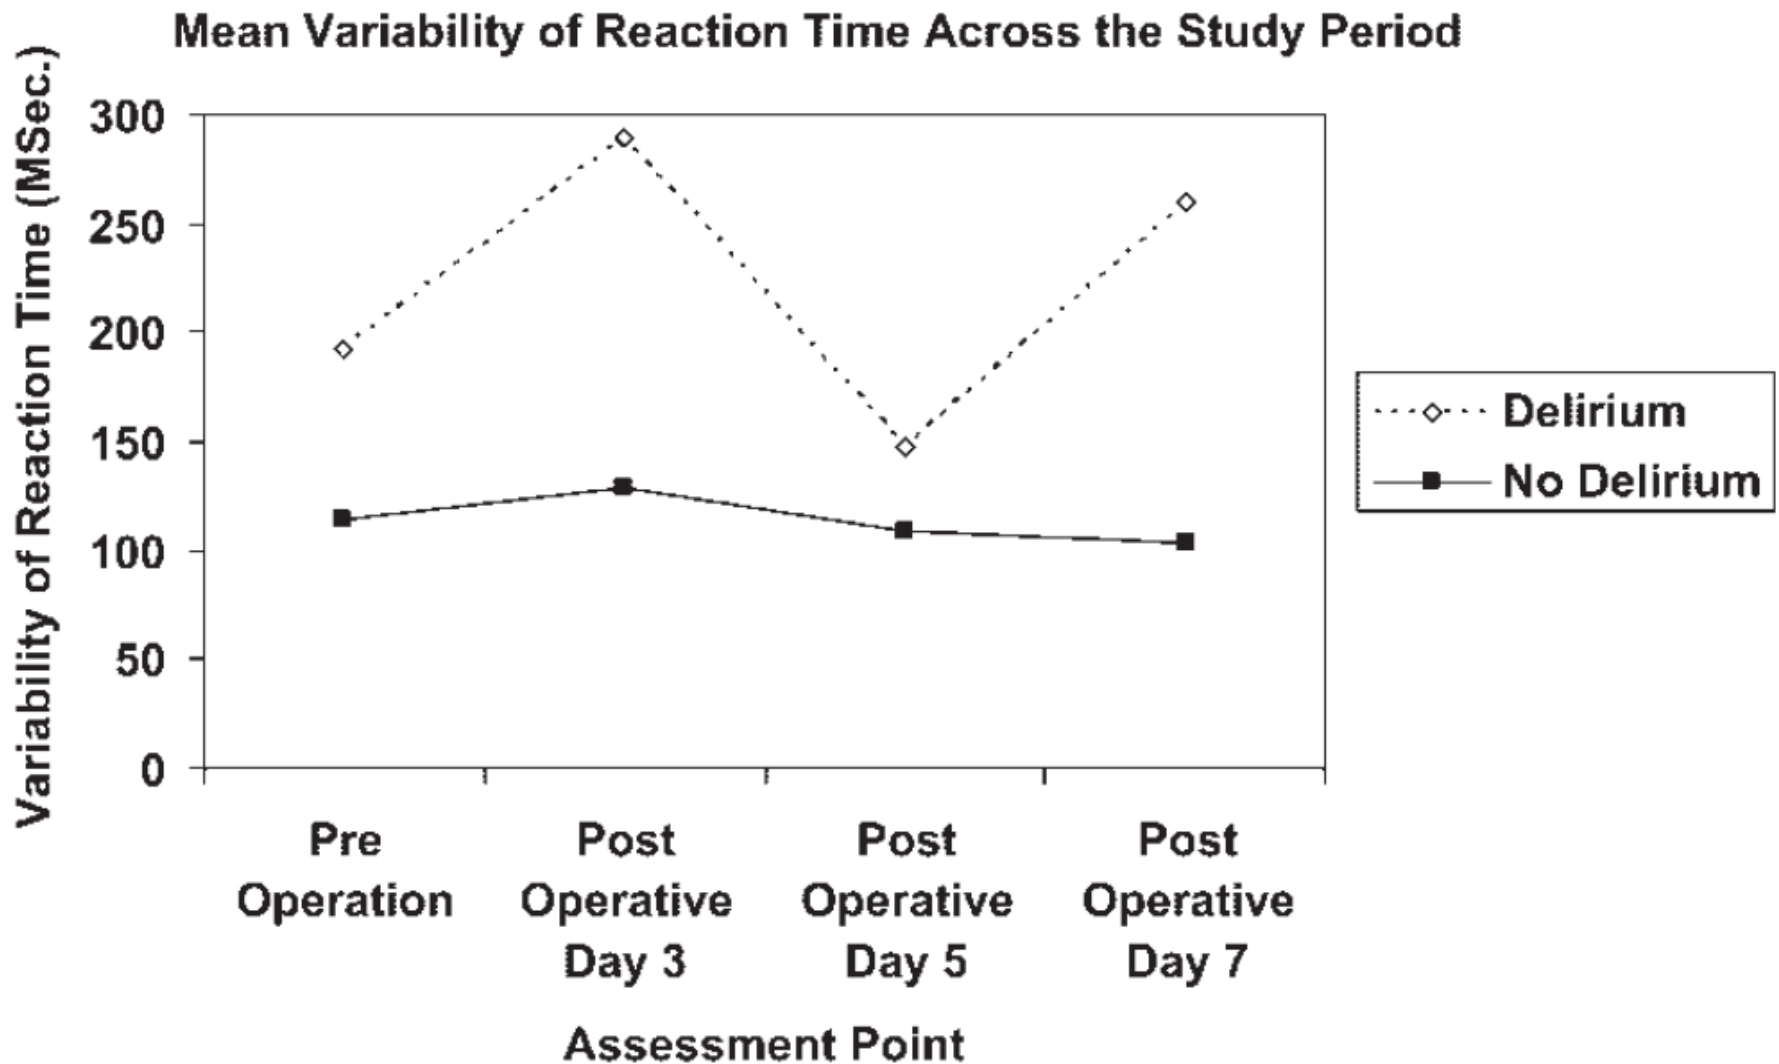

Game-Based Cognitive Assessment (Phil Lam with Dr. Jaques Lee, Delirium in the Emergency Room Application)

Delirium (short version)

- Brain stops functioning properly
- Happens quickly (onset over hours/days), and fluctuates.
- Symptom of a medical emergency (very long list of possible causes)
- **Definition currently fluid (subject to further research)**

Hypothesis

Prototype

KINECT™
for  XBOX 360.

Prototype

ng over 5, 0.
ng over 8, 0.
ng over 7, 0.

Boxes

You took 1.631 seconds to catch the ball!

Hint: Well done! Move the glove all the way to the other side to start a new trial.

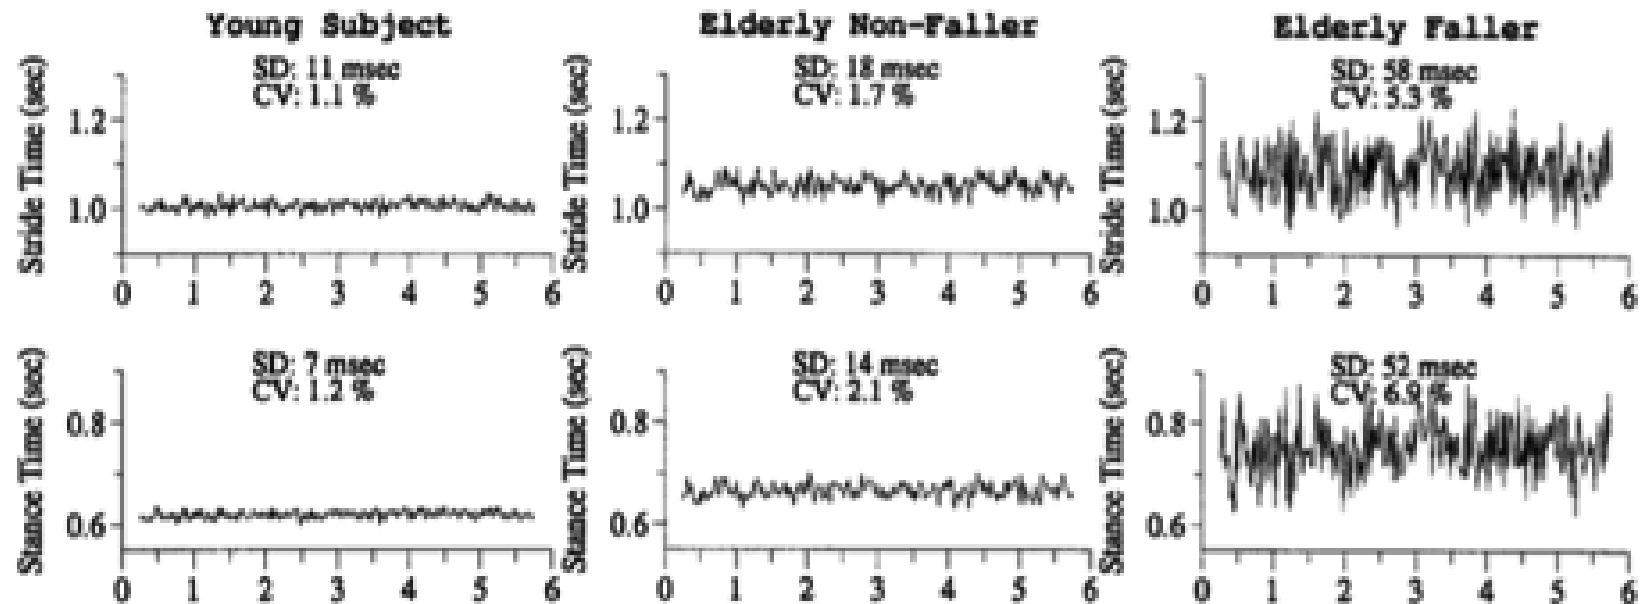

Sensor-Based Evaluation of Neuro-Rehab

(Anito Ko with Dr. Tammy Sieminowski)

- Recovery
 - from Brain or Stroke Injury
- Ambulatory Gait Analysis over six weeks
- Reduction in Gait Abnormality
 - as a measure of recovery
 - Comparison with Existing Clinical Measures
 - Relative Effectiveness across Different Diagnoses
- Usability Study
 - at Bridgepoint Hospital Fall 2010
- Shoe mounted sensor package developed by Phil Lam

Stride Variability

Hausdorff et al (1997):

People who fall have greater stride variability (unsteadiness) and spend more time with their feet on the ground

Targetted Ambulatory Gait Analysis

- Inference of gait features from combination of gyroscope and accelerometer data
- Use of clock to synchronize left and right feet
- Small package mounted on top of patient's shoe/slipper)
 - (no need to wear purpose built shoes)
- Targetted features (using findings in research literature)
 - Stride length variability (suspected cognitive component)
 - Foot flat (vertical) acceleration (aging related)
 - Stride width (disease related, e.g., Parkinsons)

Existing Work

- GaitShoe (Bamberg 2008)

- Sensors (accelerometers, gyroscopes, force, pressure, height sensors) attached to shoe
- Measured heel strike - toe off timing, pitch, velocity, stride length
- Complicated sensors

- GAITRite (Titianova 2004)

- Portable walkway with pressure sensitive sensors
- Measured location of foot, dynamic pressure, heel strike - toe off timing
- Requires a gait lab

Equipment

Sensor Package

Bridgepoint Health

- “chronic disease prevention and management”
- Comprised of Bridgepoint Hospital, Bridgepoint FHT, Bridgepoint Collaboratory for Research and Innovation, Bridgepoint Health Foundation
- Hospital provides short-term care to patients living with disabilities, multiple diseases, and those seeking rehabilitation after sudden illness
- Neurorehabilitation service provides care for patients recovering from stroke or acquired brain injury

Experimental Design

- Population
 - mean age 61 years old (sd 18.2, range 18-93)
 - mean length of stay 41 days (sd 25, range 0 - 148)
 - diagnosis: stroke (53%), traumatic brain injury (16.4%), subarachnoid hemorrhage (5.7%), subdural hematoma (3.7%), other (21.1%)
- Inclusion criteria
 - Older than 18
 - Capable of consent
 - Able to communicate in English
 - Independently ambulatory (with or without aids)

Example Patient Footwear

Equipment set up

Data collected

- 3 patients
- 3 weeks each patient, one sensor on each shoe
- Instead of learning about ambulatory gait we mostly learned about usability problems associated with the sensor package and our research methodology

Issues Encountered

- Inappropriate footwear
- Patients unwilling to participate
- Patients in hospital for only a short time
- Time required to attach / detach sensors
- Incomplete EMR records (inconsistent across pts, checkups, some information missing)

Next Steps

- Phase 2 of experiment at Bridgepoint
 - Redesigned sensor package (fourth generation!!)
 - Magnetometers for orientation
 - Ground (IR) proximity sensor for footfalls
 - Variable battery sizes
 - Flexible body sites
 - Usability study (where to put the package?)
 - Shoe
 - Anklet
 - Small of back?
 - More controlled setting
 - Collect data in cooperation with physiotherapists (e.g., walking to appointment)

Conclusions

- Huge Potential for Sensor Driven Reduction of Friction in Clinical Workflow
 - But.....
- No easy wins
- Each Application Requires
 - Careful Task Analysis
 - Extensive Human Factors Engineering
 - Innovation Technology Development and User Interface Design
 - Management of Socio-technical Systems
